Different explanations — one user-directed team

Explanatory locus is not the same axis as compositional/compilational emergence or process/state/outcome evidence.

Your task and chosen configuration

Explicit membership, roles, topology, sharing, models, tools and budgets

NON-SYSTEM — member/component-centered

Attributes, behavior, knowledge, reports and aggregates
IPO/IMOI also includes interaction, feedback and conditional relations

Collaborative intelligence

Member-focused behavioral evaluation
Optional separate saved protocol
Not an official CIB score

Shared models + reports

Explicit plans and perceived alignment
Similarity is not accuracy
No latent mental-model inference

SYSTEM — situated interaction/configuration

Work across members, artifacts, tools and time
Not synonymous with complexity science or demonstrated emergence

Distributed problem-solving

Complementary inputs and representations
Work dependencies + transformations
Hutchins / McNeese, Salas & Endsley

Transactive memory

Differentiated/compilational knowledge
Configured directory: who is assigned what
Not measured retrieval effectiveness

Interactive cognition + coordination

Situated interaction, not aggregated minds
Exposure and version-specific handoffs
Cooke et al.; no understanding inferred

Teams as dynamical systems

Local–global / substrate / cross-level
Task-specific temporal research questions
Recurrence/entropy/synchrony not estimated

Configure → set tasks → follow work → intervene

Standalone bounded engine; human-directed interventions, not automatic organizational improvement
Human-team constructs and effects require validation for AI teams; psychological states are not measured
